

300mA 20V Low-Noise Low-Dropout Regulator With Shutdown

Features

- Input Voltage Range: 2.5V to 20V
- Output Voltage Range:
 - Fixed Operation: 1.2V to 5.0V
- Maximum output current: 300mA
- Low Dropout Voltage: 152mV at 300mA
- Low Noise When Using External Bypass Cap
- Output Voltage Accuracy: 2% over Line, Load and Temperature
- Excellent Load and Line Transient Responses
- Thermal Shutdown and Over-Current Protection
- Stable with 1 μ F or Larger Ceramic Capacitor
- Operating Junction Temperature: -40°C to +125°C
- Available packages: SOT23-5

Description

The device is a fixed-output, wide-input, low-noise, low-dropout voltage regulator supporting an input voltage range from 2.5V to 20V and up to 300mA of load current. The device supports an output range of 1.2V to 5.0V.

Additionally the device has a 2% output accuracy across load, line and temperature that can meet the needs of low-voltage microcontrollers (MCUs) and processors.

Low output noise (with 10nF bypass capacitor) and wide bandwidth PSRR help attenuate the switching noise of an upstream DC/DC converter and minimize post regulator filtering.

The device also features short-circuit current limit and thermal shutdown protection, as well as automatic discharge function to quickly discharge V_{OUT} in the disabled states.

Applications

- Cellular Phones
- Laptop computers
- Portable Equipment
- Battery-Powered Systems
- High-Efficiency Linear Power Supplies

Pin Descriptions

PIN Number	PIN Name	I/O	Function
1	IN	I	Input supply voltage pin. It is recommended to use a 1 μ F or larger ceramic capacitor from IN pin to ground to get a good power supply decoupling.
2	GND	-	Ground.
3	EN	I	Enable Pin. Drive EN high to turn on the regulator. Drive EN low to turn off the regulator.
4	BYPASS	I	Connect an external 10nF capacitor from this pin to ground can reduce the output to very low noise levels. This pin can be left open if low noise at the output is not required.
5	OUT	O	Regulator output voltage pin. A 2.2 μ F or larger ceramic capacitor from OUT to ground is required to ensure regulator stability.

Notes:

1. Exposure of the device under conditions beyond the limits specified by Maximum Ratings for extended periods may cause permanent damage to the device and affect product reliability. These conditions represent a stress rating only, and functional operations of the device at these or any other conditions above the operational limits noted in this specification is not implied.

Feature Description

Enable

The enable pin for the LDO is active high. The device is enabled when the enable pin voltage is greater than $V_{IH(EN)}$ and disabled with the enable pin voltage less than $V_{IL(EN)}$. If independent control of chip enable is not needed, then connect the enable pin to the input. The LDO has an internal pulldown MOSFET that connects a discharge resistor from VOUT to ground when the device is disabled to actively discharge the output voltage.

Output Current Limit

When overload events happen, the output current is internally limited.

Undervoltage Lockout (UVLO)

The LDO uses an undervoltage lockout circuit to keep the output shut off until the internal circuitry is operating properly.

Thermal Protection

The LDO contains a thermal shutdown protection circuit to turn off the output current when excessive heat is dissipated in the LDO.
